Problem: Rebuilding MLIB can take up to 3 hours !!!

- Building MLIB can take a long time
- Much time is wasted waiting for library compilations

Solution: Use Incredibuild C++ Accelerator

- Incredibuild increases the library build speed by 30x
- Software e.g. unit tests can also be accelerated
- Rebuilding the library now takes 5 mins instead of 3 hours
- Saving time, resources and budget

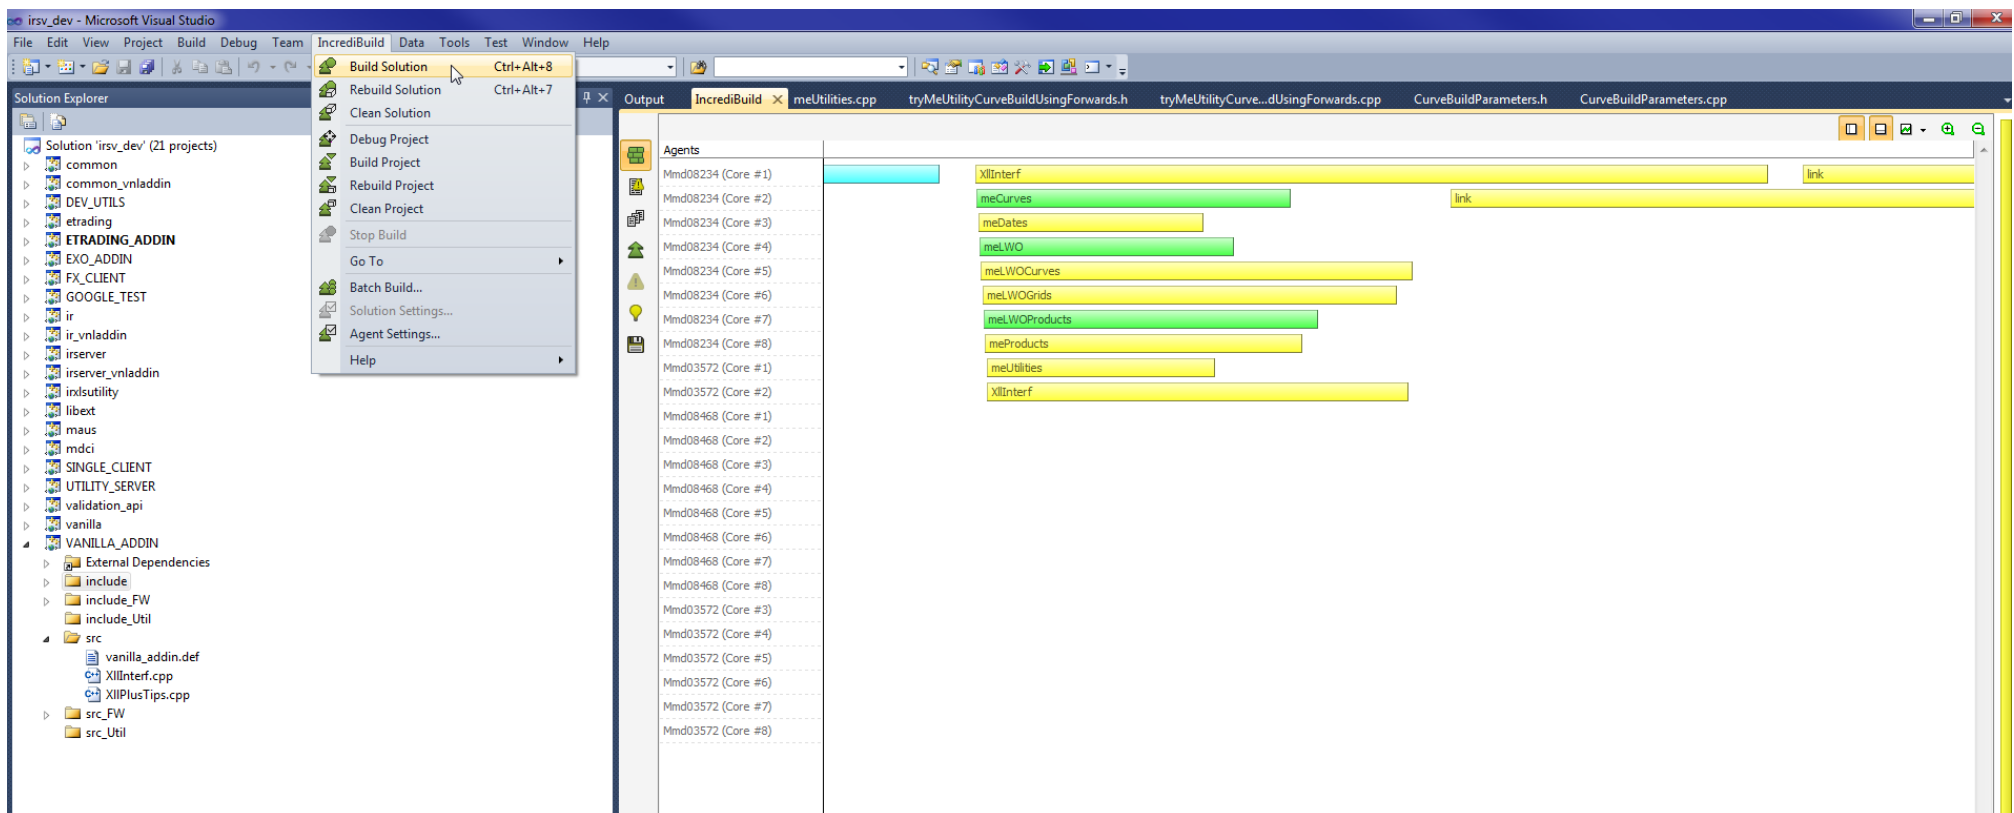

- ① How does Incredibuild Work?
- ② Using Incredibuild
- ③ Incredibuild Cost

Incredibuild

Incredibuild multi-threads the library build onto multiple PC cores and also further distributes and threads the build on local PCs or 'agents' when they are not busy. The London Quants share their PCs when building MLIB.

- A coordinator monitors agent availability
- Agents can opt out from the process at any time
- Incredibuild can be run on a server or locally.
- London use the local solution, which took 5 mins to set-up and install.

- Incredibuild is accessed via Visual Studio and / or command-line
- Select Incredibuild -> Build Solution to build
- Your code will now compile using the inactive PC cores in your team

Incredibuild has a one-time upfront cost and annual licence cost.

- Upfront Cost: USD 500 per agent (one-time)
- Licence Cost: USD 150 per agent per year

The End
